Software Update Notes

- Secure password storage implemented
- Password checking implemented
- Began database updates

- Briefly describe the artifact. What is it? When was it created?

The artifact is a full stack inventory control application. It includes a database to store items and users as well as a user interface to manage database functions. It was created April 5th, 2026 for CS360 Mobile Application Development.

- Justify the inclusion of the artifact in your ePortfolio. Why did you select this item? What specific components of the artifact showcase your skills and abilities in software development? How was the artifact improved?

I selected this item because it was the one that could most readily be changed into something more focused with my personal experience. As a pharmacy technician I have a lot of experience with what patients need and an overwhelming amount of them have trouble tracking when refills are due. This artifact will show not only my competency in developing software but will show that I can use that competency to create real world functional problem-solving applications. The application is improved by altering its function from inventory control to prescription refill tracking.

- Did you meet the course outcomes you planned to meet with this enhancement in Module One? Do you have any updates to your outcome-coverage plans?

The course outcome achieved this week is:

Design and evaluate computing solutions that solve a given problem using algorithmic principles and computer science practices and standards appropriate to its solution, while managing the trade-offs involved in design choices (data structures and algorithms)

With the password security changes implemented as my algorithm/data structure requirement, I've shifted my focus away from database searching and on to improving the information relayed to the user as my database upgrade. This is due to difficulty updating the recycler view with each search and the relative complexity of the password storage, retrieval, and comparison algorithms.

- Reflect on the process of enhancing and modifying the artifact. What did you learn as you were creating it and improving it? What challenges did you face?

Working on this project again has been inetersing mostly due to me not realizing just how many things can be changed and updated. It seems simple to swap the function of the application from items to prescriptions but between adding password security, database searching, date tracking and persistent monitoring of status this project will see a lot of improvements. The biggest challenge I'm facing is not remembering which files hold which functions exactly. It takes me a few minutes to remember the organizational structure of the program so that I can build working features.
